[Financial Econometrics, Mathematics and Statistics](#) Aug 22 2021 This rigorous textbook introduces graduate students to the principles of econometrics and statistics with a focus on methods and applications in financial research. Financial Econometrics, Mathematics, and Statistics introduces tools and methods important for both finance and accounting that assist with asset pricing, corporate finance, options and futures, and conducting financial accounting research. Divided into four parts, the text begins with topics related to regression and financial econometrics. Subsequent sections describe time-series analyses; the role of binomial, multi-nomial, and log normal distributions in option pricing models; and the application of statistics analyses to risk management. The real-world applications and problems offer students a unique insight into such topics as heteroskedasticity, regression, simultaneous equation models, panel data analysis, time series analysis, and generalized method of moments. Written by leading academics in the quantitative finance field, allows readers to implement the principles behind financial econometrics and statistics through real-world applications and problem sets. This textbook will appeal to a less-served market of upper-undergraduate and graduate students in finance, economics, and statistics.

[Federal Tax Accounting](#) Jul 29 2019 This new edition of Federal Tax Accounting, part of the Graduate Tax Series, has been updated with new problems, discussions, commentary, analysis, and additional coverage of many topics. Chapters 1 and 7 have been substantially revised and reorganized. Chapters 5, 6, and 7 have expanded text with more examples and few but more focused problems. Other changes include: • Revised and expanded discussion of "taxable year" with problems, now in the first chapter; • Expanded discussion of tax accounting vs. financial accounting; • Discussion of Section 409A regulations, with a new problem; • Expanded discussion of inventories, with additional problems; • Additional commentary on accrual of income of doubtful collectability and bad debts, including *Trinity Indus. v. Commissioner* and *Rendall v. Commissioner*; • Updated discussion of Section 448(d) (5) regulations on non-accrual experience method; • New problem dealing with trade discounts, in light of *Westpac Pacific Foods v. Commissioner* and the *Advance Trade Discount Method* of Rev. Proc. 2007-53; • Updated material on proposed regulations on capitalization of tangible property expenditures; • Expanded treatment of advertising expenditures; • Expanded discussion of investment interest, prepaid interest and personal interest, including Chief Counsel Adv. 2009-11-007, applying qualified residence interest limitation per residence as well as per taxpayer; • Expanded explanation of original issue discount and market premium with examples; • Commentary on gifts of the use of property in light of the *Dickman* decision and the Section 7872 regulations; • Extensive additional text and explanation, with examples, of various aspects of installment reporting, with fewer, more focused problems; • A new section on installment sales coupled with a like-kind exchange with boot, with example and problem; • Expanded discussion of NOL carryovers, including the text of Rev. Rul. 81-88 and commentary; • Comment on accrual method issues similar to those in *United States v. Lewis*; and, • Expanded detailed analysis and discussion of Section 1341, with the text of Rev. Rul. 68-153, *Zadoff v. United States*, and *Barrett v. Commissioner*. The sophisticated realistic problems with a transactional focus are an integral part of Federal Tax Accounting. These problems require careful analysis and application of the code and regulation provisions, administrative pronouncements, case law, and other relevant sources. Perhaps more important for a graduate tax program, the problems not only require careful analysis, but the application requires dealing with situations in which the most careful reading of the materials does not supply the answer.

WHAT THIS BOOK IS FOR Students have generally found accounting a difficult subject to understand and learn. Despite the publication of hundreds of textbooks in this field, each one intended to provide an improvement over previous textbooks, students of accounting continue to remain perplexed as a result of numerous subject areas that must be remembered and correlated when solving problems. Various interpretations of accounting terms also contribute to the difficulties of mastering the subject. In a study of accounting, REA found the following basic reasons underlying the inherent difficulties of accounting: No systematic rules of analysis were ever developed to follow in a step-by-step manner to solve typically encountered problems. This results from numerous different conditions and principles involved in a problem that leads to many possible different solution methods. To prescribe a set of rules for each of the possible variations would involve an enormous number of additional steps, making this task more burdensome than solving the problem directly due to the expectation of much trial and error. Current textbooks normally explain a given principle in a few pages written by an accounting professional who has insight into the subject matter not shared by others. These explanations are often written in an abstract manner that causes confusion as to the principle's use and application. Explanations then are often not sufficiently detailed or extensive enough to make the reader aware of the wide range of applications and different aspects of the principle being studied. The numerous possible variations of principles and their applications are usually not discussed, and it is left to the reader to discover this while doing exercises. Accordingly, the average student is expected to rediscover that which has long been established and practiced, but not always published or adequately explained. The examples typically following the explanation of a topic are too few in number and too simple to enable the student to obtain a thorough grasp of the involved principles. The explanations do not provide sufficient basis to solve problems that may be assigned for homework or given on examinations. Poorly solved examples such as these can be presented in abbreviated form which leaves out much explanatory material between steps, and as a result requires the reader to figure out the missing information. This leaves the reader with an impression that the problems and even the subject are hard to learn - completely the opposite of what an example is supposed to do. Poor examples are often worded in a confusing or obscure way. They might not state the nature of the problem or they present a solution, which appears to have no direct relation to the problem. These problems usually offer an overly general discussion - never revealing how or what is to be solved. Many examples do not include accompanying diagrams or graphs denying the reader the exposure necessary for drawing good diagrams and graphs. Such practice only strengthens understanding by simplifying and organizing accounting processes. Students can learn the subject only by doing the exercises themselves and reviewing them in class, obtaining experience in applying the principles with their different ramifications. In doing the exercises by themselves, students find that they are required to devote considerable more time to accounting than to other subjects, because they are uncertain with regard to the selection and application of the theorems and principles involved. It is also often necessary for students to discover those "tricks" not revealed in their texts (or review books) that make it possible to solve problems easily. Students must usually resort to methods of trial and error to discover these "tricks," therefore finding out that they may sometimes spend several hours to solve a single problem. When reviewing the exercises in classrooms, instructors usually request students to take turns in writing solutions on the boards and explaining them to the class. Students often find it difficult to explain in a manner that holds the interest of the class, and enables the remaining students to follow the material written on the boards. The remaining students in the class are thus too occupied with copying the material off the boards to follow the professor's explanations. This book is intended to aid students in accounting overcome the difficulties described by supplying detailed illustrations of the solution methods that are usually not apparent to students. Solution methods are illustrated by problems that have been selected from those most often assigned for class work and given on examinations. The problems are arranged in order of complexity to enable students to learn and understand a particular topic by reviewing the problems in sequence. The problems are illustrated with detailed, step-by-step explanations, to save the students large amounts of time that is often needed to fill in the gaps that are usually found between steps of illustrations in textbooks or review/outline books. The staff of REA considers accounting a subject that is best learned by allowing students to view the methods of analysis and solution techniques. This learning approach is similar to that practiced in various scientific laboratories, particularly in the medical fields. In using this book, students may review and study the illustrated problems at their own pace; students are not limited to the time such problems receive in the classroom. When students want to look up a particular type of problem and solution, they can readily locate it in the book by referring to the index that has been extensively prepared. It is also possible to locate a particular type of problem by glancing at just the material within the boxed portions. Each problem is numbered and surrounded by a heavy black border for speedy identification.
