Nonlinear Optics Nov 14 2020 The field of nonlinear optics developed gradually with the invention of lasers. After the discovery of second-harmonic generation in quartz, many other interesting nonlinear optical processes were rapidly discovered. Simultaneously theoretical programmes for the understanding of nonlinear optical phenomena were stimulated in accordance to develop structure-property relationships. In the beginning, research advances were made on inorganic ferroelectric materials followed by semiconductors. In the 1970's, the importance of organic materials was realised because of their nonlinear optical responses, fast optical response, high laser damage thresholds, architectural flexibility, and ease of fabrication. At present materials can be classified into three categories - inorganic ferroelectrics, semiconductors, and organic materials. Advances have also been made in quantum chemistry approaches to investigate nonlinear optical susceptibilities and in the development of novel nonlinear optical devices. Generally, inorganic and organic nonlinear optical materials and their related optical processes are reported in separate meetings. This book collects for the first time papers covering the recent developments and areas of present research in the field of nonlinear optical materials.

A Lightweight, Low-profile Antenna for Airborne Station-keeping Application Mar 19 2021 The report describes a low-profile, all dielectric lightweight antenna array to replace the directional antenna for the AN/APN 169 Aircraft Station-Keeping Antenna. The array consists of eight (LEXAN) polycarbonate channel guide elements partially plated with copper enabling the antenna system to be reduced from the present 8 inches in height to less than 2 inches. Design data and radiation patterns are given for the individual elements as well as for the eight-element array. (Author).

Guided-Wave Optoelectronics Nov 26 2021 The first guided-wave components that employed signals in the form of light beams traveling along thin films were fabricated a little more than two decades ago. The parallel development of semiconductor lasers and the subsequent availability of low-loss optical fibers made possible the imple mentation of completely optical systems for communications, signal pro cessing and other applications that had used only electronic

circuitry in the past. Referred to as integrated optics, this technology has been rein forced by utilizing electronic components that act as controlling elements or perform other functions for which the optical counterparts are not as effec tive. The broader area thus generated was aptly named optoelectronics and it currently represents a fascinating, rapidly evolving and most promising technology. Specifically, the amalgamation of electronic and optics compo nents into an integrated optoelectronics format is expected to provide a wide range of systems having miniaturized, high speed, broad band and reliable components for telecommunications, data processing, optical computing and other applications in the near and far future. This book is intended to cover primarily the optical portion of the op toelectronics area by focusing on the theory and applications of components that use guided optical waves. Hence all aspects of integrated optics are dis cussed, but optoelectronic components having primarily electronic rather than optical functions have not been included. Each chapter has been writ ten by experts who have actively participated in developing the specific areas addressed by them.
