Dash Lights - Illuminating Changes from the 60's Through the 90's Apr 19 2021 As I was researching the coverage of dash panels in manufacturers' press materials and brochures, a curious pattern emerged. Unless the dashboard or instruments introduced a new technology, dashes were rarely covered or photographed. Even rarer was the presence of an illuminated dash. That became the subject of this book with over 110 photographs.

Advances in Occupational Ergonomics and Safety Oct 02 2019 Ergonomics touches every man, woman and child each day of their lives whether they recognise it or not. Ergonomics (or lack of it) plays a more significant role in the lives of about two-thirds of the world's population over 10 years of age who work for one-third of their lives to make a living. There are 120 million occupational accidents and injuries and 200,000 fatalities each year according to WHO 95. Occupational accidents, injuries and fatalities are undesired events. The occupational activities are planned and designed, and executed with a purpose under supervision but accidents are not. Hence it stands to reason that better planning, design and execution will help to reduce these undesirable outcomes. One must also recognise that under global scheme of biological evolution, the human beings were not designed to endure a life long exposure to artificial activities repetitively. Thus occupational health problems are inevitable if we do not return to nature for our sustenance. As a society, we have chosen to live and work as we do. In fact, there is a far rapid evolution (mutation and speciation) of occupations than of any biological organism. This places us in a situation where better planning, design and execution of our occupational activities have become absolute necessity. However, since ergonomics is a modifier and not a causal factor, its significance does not become immediately apparent to us. Perhaps it is for this reason that even in developed world occupational health services are available to between 20% to 50% of the work force and less than 10% of the workforce in the developing countries. Occupational health services are remedial approaches. The rational wisdom of the human race should strive to get proactive control of undesirable outcomes through ergonomics. Unfortunately, it is sadly lacking even today. On an optimistic note one can observe that its presence and application is slowly increasing.

Aluminium Jun 29 2019 This comprehensive report examines the state of the world aluminium industry at the start of the 21st century, reviewing the aftermath of 1994's Memorandum of Understanding (MoU), which mothballed 1.5m tonnes of capacity and led to a sharp rise in prices. It examines the damage done to aluminium demand from both the automotive and beverage can sectors, and the effects of talk of recession in the US and Europe in 2001. However, it finds that aluminium is at last beginning to see signs of success in the mass-produced end of the automotive market with the launch of the Audi A2. Packaging demand is also holding up, although PET is continuing to make gains in the beverage container market. Up-to-date, in-depth research and analysis to make you an authority on the world's major nickel markets This new report is a vital aid to surviving and prospering in a complex and changing market. Some key findings of this report Western Europe remains a net importer of primary aluminium, with imports of over 2 million tonnes. If the expected growth in per capita aluminium consumption up to 2010 takes place, Europe will rely even more heavily on imported metal from countries such as Russia and the Gulf Co-operation Council countries. Chinese demand for aluminium in building and construction is forecast to grow at an impressive 15% per year. Aluminium will provide 68% of the material weight of the airframe of the new Airbus A3XX. Using current Airbus design principles, about 980 tonnes of semi-finished aluminium products will be needed per aircraft. Aluminium applications in industrial vehicles grew by 4-5% in the five years to 2000; however, they could increase worldwide by 30-50% by 2005. Aluminium bridges are a new and promising market, with recent technological advances making it possibly to construct bridges with spans of up to 100 metres or more. The three biggest European construction markets for aluminium are Italy, with 270,000 tonnes, Germany with 210,000 tonnes and the UK, with 150,000 tonnes.
