**Arguments on Evolution** Apr 19  
2021 This book surveys the current debates in evolutionary theory from a paleontological perspective, discussing such

controversial topics as punctuated equilibrium, species selection, mass extinctions, and taxonomic diversification of the biosphere. These ideas are critically reviewed and presented in the context of a broad background: the neodarwinian paradigm of modern evolutionary biology, the potential and limitations of the fossil record as a source of data on organic evolution, and the methodology of evolutionary interpretation of paleontological data. The author argues that much current research leads us astray, and proposes that

interpretation of the history of the biosphere be adopted--one based on the assumption that there are no general laws, that large-scale historical biological patterns merely reflect a summation of smaller-scale phenomena, and that none of these components must be neglected in our attempts to explain the larger patterns. Clear and concise, this book will be invaluable to scientists and students and accessible to interested lay readers.

[Biotic Regulation of the Environment](#) Feb 04 2020 It is not possible to understand the apparent stability of the Earth's climate and environment unless we can fully understand how the best possible environmental

conditions may be maintained for life to exist. Human colonization of areas with natural biota, for industrial or agricultural activities, will lead to degradation of those natural communities and violation of the BRE (biotic regulation of the environment) principle. Thus to maintain an environment on Earth that is suitable for life it is necessary to preserve and allow the natural recovery of natural biotic communities, both in the oceans and on land. This book is devoted to a quantitative version of the BRE concept, and is built on a foundation of modern scientific knowledge accumulated in the
