color, drawing from physics, physiology and psychology. This book comprises eight chapters and begins by tracing scientific thinking about color since the seventeenth century. This historical perspective provides an introduction to the fundamental questions in color science, by following advances as well as misconceptions over more than 300 years. The next chapters then discuss the relationship between light, the retinal image, and photoreceptors, followed by a focus on concepts such as color matching and color discrimination; color appearance and color difference specification; the physiology of color vision; the 15 mechanisms of the physics and chemistry of color; and digital color reproduction. Each chapter begins with a short outline that summarizes the organization and breadth of its material. The outlines are valuable guides to chapter structure, and worth scanning even by readers who may not care to go through a chapter from start to finish. This book will be of interest to scientists, artists, manufacturers, and students.

Spektroskopische Methoden in der organischen Chemie Dec

30 2021 Dieses Standardwerk vermittelt alle notwendigen Kenntnisse für die Anwendung der spektroskopischen Methoden in der organischen Chemie. Einführende Grundlagentexte erläutern die Theorie, anschauliche Beispiele die Umsetzung in der Praxis. Dieses Buch ist Pflichtlektüre für Studierende der Chemie und Nachschlagewerk für Profis. Die 9. Auflage ist

komplett überarbeitet und erweitert. Insbesondere das NMR-Kapitel und dessen <sup>13</sup>C-NMR-Teil sind stark verändert gegenüber der Voraufgabe. In aktualisierter Form präsentiert sich das Kapitel zum Umgang mit Spektren und analytischen Daten: Es erklärt die kombinierte Anwendung der Spektroskopie, enthält Anleitungen zur Interpretation analytischer Daten, hilft bei der Strukturaufklärung/-überprüfung und bietet Praxisbeispiele. Zusätzlich finden Nutzer des Buches Beispiele zur Interpretation analytischer Daten und Strukturaufklärung mit Lösungen kostenfrei auf unserer Website. Dozenten erhalten auf Anfrage alle Spektren des Werks zum Download.

*Research in Chemistry at Undergraduate Institutions* Sep 14 2020 The authors present evidence for the role of undergraduate research in college completion and preparation of a highly skilled workforce, particularly in STEM fields.

*Reagents for Silicon-Mediated Organic Synthesis* Jun 04 2022 Over the last three decades the importance of organosilicon chemistry has greatly increased because it has opened a number of new synthetic strategies. Silicon reagents are usually low-cost, versatile and allow a wide range of reactions. This is the first Handbook to compile essential Silicon containing reagents and make use of the leading reagent database e-EROS. Another hot volume in the series *Handbooks of Reagents for Organic Synthesis*, this is a must-have resource for all synthetic chemists working in drug development and medicinal chemistry. For the selection the Editor focussed on three key synthetic approaches with the greatest impact: 1. Use of silicon as a 'temporary tether' by unifying a reactive pair of functional groups and taking advantage of their template-biased intramolecular cyclization. 2. The specific use of the silane functionality as a hetero-butyl group, often colloquially referred to as the use of silicon as a 'fat proton'. 3. The use of the Brook rearrangement as an 'anion relay stratagem'. A new feature

in this Handbook is the reagent finder, alphabetically organized lookup table arranged by organic functionality and specific structure of the silicon atom to which it is bound.

*The Natural Environment and the Biogeochemical Cycles* Jun 11 2020 Environmental Chemistry is a relatively young science. Interest in this subject, however, is growing very rapidly and, although no agreement has been reached as yet about the exact content and limits of this interdisciplinary discipline, there appears to be increasing interest in seeing environmental topics which are based on chemistry embodied in this subject. One of the first objectives of *Environmental Chemistry* must be the study of the environment and of natural chemical processes which occur in the environment. A major purpose of this series on *Environmental Chemistry*, therefore, is to present a reasonably uniform view of various aspects of the chemistry of the environment and chemical reactions occurring in the environment. The industrial activities of man have given a new dimension to *Environmental Chemistry*. We have now synthesized and described over five million chemical compounds and chemical industry produces about hundred and fifty million tons of synthetic chemicals annually. We ship billions of

tons of oil per year and through mining operations and other geophysical modifications, large quantities of inorganic and organic materials are released from their natural deposits. Cities and metropolitan areas of up to 15 million inhabitants produce large quantities of waste in relatively small and confined areas. Much of the chemical products and waste products of modern society are released into the environment either during production, storage, transport, use or ultimate disposal. These released materials participate in natural cycles and reactions and frequently lead to interference and disturbance of natural systems.
