Symmetry Breaking in Syntax and the Lexicon Feb 06 2020 This book is a research monograph that explores the implications of the strongest minimalist thesis from an antisymmetric perspective. Three empirical domains are investigated: nominal root compounds in German and English, nominal gerunds in English and their German counterparts, and small clauses in Russian and English. A point of symmetry that has the potential of stalling the derivation emerges in the derivation of all of these constructions. Building on certain assumptions on how Merge works, this book shows that the points of symmetry can all be resolved in the same way; despite the fact that the three empirical domains under investigation are standardly derived from distinct structural configurations, such as head-head merger in the case of root compounds, head-phrase merger as it arises from standard complementation/predication structures for nominal gerunds, and phrase-phrase merger in small clauses. This book is of interest to all researchers working on syntax and its interfaces.

**Questions and Information Systems** Nov 09 2022 The design and functioning of an information system improve to the extent that the system can handle the questions people ask. Surprisingly, however, researchers in the cognitive, computer, and information sciences have not thoroughly examined the multitude of relationships between information systems and questions -- both question asking and answering. The purpose of this book is to explicitly examine these relationships. Chapter contributors believe that questions play a central role in the analysis, design, and use of different kinds of natural or artificial information systems such as human cognition, social interaction, communication networks, and intelligent tutoring systems. Their efforts show that data structures and representations need to be organized around the questioning mechanisms in order to achieve a quick retrieval of relevant useful information.

Mathematical Encounters of the Second Kind Aug 14 2020 A number of years ago, Harriet Sheridan, then Dean of Brown University, organized a series of lectures in which individual faculty members described how it came about that they entered their various fields. I was invited to participate in this series and found in the invitation an opportunity to recall events going back to my early teens. The lecture was well received and its reception encouraged me to work up an expanded version. My manuscript lay dormant all these years. In the meanwhile, sufficiently many other mathematical experiences and encounters accumulated to make this little book. My 1981 lecture is the basis of the first piece: "Napoleon's Theorem." Although there is a connection between the first piece and the second, the four pieces here are essentially independent. The second piece, "Carpenter and the Napoleon Ascription," has as its object a full description of a certain type of scholar-storyteller (of whom I have known and admired several). It is a pastiche, containing a salad bar selection blended together by my own imagination. This piece purports, as a secondary goal, to present a solution to a certain unsolved historical problem raised in the first piece. The third piece, "The Man Who Began His Lectures with 'Namely'," is a short reminiscence of Stefan Bergman, one of my teachers of graduate mathematics. Bergman, a remarkable personality, was born in Poland and came to the United States in 1939.

Lean Enterprise Software and Systems Jul 25 2021 The LESS 2010 conference was the first scientific conference dedicated to advancing the "lean enterprise software and systems" body of knowledge. It fostered interactions by joining the lean product development community with the agile community coupled with innovative ideas nurtured by the beyond budgeting school of thinking. The conference was organized in collaboration with the Lean Software and Systems Consortium (LSSC). The conference is established as a conference series. The idea of the conference was to offer a unique platform for advancing the state of the art in research and practice by bringing the leading researchers and practitioners to the same table. Indeed, LESS 2010 attracted a unique mix of participants including academics, researchers, leading consultants and industry practitioners. The aim of the conference was to use this diverse community to advance research and practical knowledge concerning lean thinking within the field of software business and development. LESS 2010 had more than 60% of its speakers come from the industry and the remaining from academia. LESS is poised to grow as we advance into future iterations of the conference and become the conference for lean thinking in systems and software development. Its growth and credibility will be advanced by the communities and knowledge exchange platform it provides. LESS offers several avenues for knowledge exchange to create a highly collaborative environment. Each year, we aim to bring novelty to a program that fosters collaboration, letting new ideas thrive during and after the conference.

Why Agree? Why Move? Jul 01 2019 An argument that not only do movement and agreement occur in every language, they also work in tandem to imbue natural language with enormous expressive power. An unusual property of human language is the existence of movement operations. Modern syntactic theory from its inception has dealt with the puzzle of why movement should occur. In this monograph, Shigeru Miyagawa combines this question with another, that of the occurrence of agreement systems. Using data from a wide range of languages, he argues that movement and agreement work in tandem to achieve a specific goal: to imbue natural language with enormous expressive power. Without movement and agreement, he contends, human language would be merely a shadow of itself, with severe limitation on what can be expressed. Miyagawa investigates a variety of languages, including English, Japanese, Bantu languages, Romance languages, Finnish, and Chinese. He finds that every language manifests some kind of agreement, some in the form of the familiar person/number/gender system and others in the form of what Katalin É. Kiss calls "discourse configurational" features such as topic and focus. A key proposal of his argument is that the computational system in syntax deals with the wide range of agreement types uniformly—as if there were just one system—and an integral part of this computation turns out to be movement. Why Agree? Why Move? is unique in proposing a unified system for movement and agreement across language groups that are vastly diverse—Bantu languages, East Asian languages, Indo-European languages, and others.

**Case-Based Learning** Dec 30 2021 Case-based reasoning means reasoning based on remembering previous experiences. A reasoner using old experiences (cases) might use those cases to suggest solutions to problems, to point out potential problems with a solution being computed, to interpret a new situation and make predictions about what might happen, or to create arguments justifying some conclusion. A case-based reasoner solves new problems by remembering old situations and adapting their solutions. It interprets new situations by remembering old similar situations and comparing and contrasting the new one to old ones to see where it fits best. Case-based reasoning combines reasoning with learning. It spans the whole reasoning cycle. A situation is experienced. Old situations are used to understand it. Old situations are used to solve a problem (if there is one to be solved). Then the new situation is inserted into memory alongside the cases it used for reasoning, to be used another time. The key to this reasoning method, then, is remembering. Remembering has two parts: integrating cases or experiences into memory when they happen and recalling them in appropriate situations later on. The case-based reasoning community calls this related set of issues the indexing problem. In broad terms, it means finding in memory the experience closest to a new situation. In narrower terms, it can be described as a two-part problem: assigning indexes or labels to experiences when they are put into memory that describe the situations to which they are applicable, so that they can be recalled later; and at recall time, elaborating the new situation in enough detail so that the indexes it would have if it were in the memory are identified. Case-Based Learning is an edited volume of original research comprising invited contributions by leading workers. This work has also been published as a special issues of MACHINE LEARNING, Volume 10, No. 3.

**On the Typology of Wh-questions** Aug 02 2019 Offers an explanation for a long-standing question in the typological distinction among languages with respect to formation of interrogatives which use questions words such as "who" and "what." Proposes that the availability of question particles and the properties of question words contribute to the typological distinctions found, and argues that the availability of question particles correlates with the lack of fronting of question words. Of interest to scholars working on interrogatives, syntactic theory, comparative syntax, Chinese syntax, and typology. Annotation copyrighted by Book News, Inc., Portland, OR

**Questions of Syntax** Oct 28 2021 There are far more syntactically distinct languages than we might have thought; yet there are far fewer than there might have been. Questions of Syntax collects sixteen papers authored by Richard S. Kayne, a preeminent theoretical syntactician, who has sought over the course of his career to understand why both these facts are true. With a particular emphasis on comparative syntax, these chapters collectively consider how wide a range of questions the field of syntax can reasonably attempt to ask and then answer. At issue, among other topics, are the relation between syntax and (certain aspects of) semantics, the relation between syntax and what appear to be lexical questions, the relation between syntax and morphology, the relation between syntax and certain aspects of phonology (insofar as silent elements and their properties play a substantial role), and the extent to which comparative syntax can provide new and decisive evidence bearing on these different kinds of questions. To Kayne, comparative syntax can shed light on what may initially seem lexical questions, and antisymmetry on the evolution of human language itself. Taken as a whole, these essays elucidate the theoretical contributions of one the most influential scholars in linguistics.

**Asymmetry in Grammar** Apr 09 2020 Asymmetry in Grammar: Syntax and Semantics brings to fore the centrality of asymmetry in DP, VP and CP. A finer grained articulation of the DP is proposed, and further functional projections for restrictive relatives, as well as a refined analyses of case identification and presumptive pronouns. The papers on VP discuss further asymmetries among arguments, and between arguments and adjuncts. Double-object constructions, specificational copula sentences, secondary predicates, and the scope properties of adjuncts are discussed in this perspective. The papers on CP propose a further articulation of the phrasal projection, justifications for Remnant IP movement, and an analysis of variation in clause structure asymmetries. The papers in semantics support the hypothesis that interpretation is a function of configurational asymmetry. The type/token information difference is further argued to correspond to the partition between the upper and lower level of the phrase. It is also proposed that Point of View Roles are not primitives of the pragmatic component, but are head-dependent categories. Configurationality is further argued to be required to distinguish contrastive from non-contrastive Topic. Compositionality is proposed to explain cross-linguistic variations in the selectional behavior of typologically different languages. The papers in syntax include contributions from Antonia Androutsopoulou and Manuel Español-Echevarría, Dana Isac, Edit Jakab, Cedric Boeckx, Julie Anne Legate, Maria Cristina Cuervo, Jacqueline Guéron, Niina Zhang, Thomas Ernst, Manuela Ambar, Jean-Yves Pollock, Anna Maria Di Sciullo, Ilena Paul and Stanca Somesfalean. The papers on semantics include contributions of Greg Carlson, Peggy Speas and Carol Tenny, Chungmin Lee, and James Pustejovsky.

**Partitions and Atoms of Clause Structure** Sep 26 2021 This collection brings together some of Dominique Sportiche's best work, including essays that are published here for the first time. The articles discuss the architecture of syntax in natural languages and Sportiche suggests that languages do not differ at all in their syntactic organization. This view takes shape through the analysis of a variety of syntactic configurations and essays examine what it means to be a Subject, how Case marking functions, how it relates to Agreement, and how Pronominal Clitic Constructions should be analyzed.

*The Acquisition of Word Order* Mar 01 2022 Within a new model of language acquisition, this book discusses verb second (V2) word order in situations where there is variation in the input. While traditional generative accounts consider V2 to be a parameter, this study shows that, in many languages, this word order is dependent on fine distinctions in syntax and information structure. Thus, within a split-CP model of clause structure, a number of "micro-cues" are formulated, taking into account the specific context for V2 vs. non-V2 (clause type, subcategory of the elements involved, etc.). The micro-cues are produced in children's L-language grammars on exposure to the relevant input. Focusing on a dialect of Norwegian, the book shows that children generally produce target-consistent V2 and non-V2 from early on, indicating that they are sensitive to the micro-cues. This includes contexts where word order is dependent on information structure. The children's occasional non-target-consistent behavior is accounted for by economy principles."

**Cross-linguistic Aspects of Processability Theory** Jul 13 2020 Seven years ago Manfred Pienemann proposed a novel psycholinguistic theory of language development, Processability Theory (PT). This volume examines the typological plausibility of PT. Focusing on the acquisition of Arabic, Chinese and Japanese the authors demonstrate the

capacity of PT to make detailed and verifiable predictions about the developmental schedule for each language. This cross-linguistic perspective is also applied to the study of L1 transfer by comparing the impact of processability and typological proximity. The typological perspective is extended by including a comparison of different types of language acquisition. The architecture of PT is expanded by the addition of a second set of principles that contributes to the formal modeling of levels of processability, namely the mapping of argument-structure onto functional structure in lexical mapping theory. This step yields the inclusion of a range of additional phenomena in the processability hierarchy thus widening the scope of PT.
